GeoIP

Inhaltsverzeichnis

- 1 Installation of the extended geo ip database

Describes the installation of the extended geo ip database to be able to use city names.

The following functions are using data of the geo ip database:

- !location command
- welcomemessages
- funmessages

The delivered geo ip database offers only continent and country data. To get city data you need the extended (bigger) database.

1 Installation of the extended geo ip database

The following steps are necessary to that end:

- Download the "GeoLite2 City" database in the "MaxMind DB binary, gzipped" format from this site.
- Open or extract the GZ download with an appropriate program.
- Copy the file `GeoLite2-City.mmdb`, which is located in the subfolders, to the following target: `GSManager/daemon/libraries/geoip/`

To test the installation, restart the GSManager an check the output/logfile for the following line: `Info: GeoIP: Database ... successfully opened`. You should see that the new database `GeoLite2-City.mmdb` is used instead of the standard database `geoip.mmdb`.
