

Installing PHP [Windows]

Inhaltsverzeichnis

- [1 Downloading PHP](#)
- [2 Unpacking PHP](#)
- [3 Modify the INI File](#)

This will show you how to install PHP on Windows.

1 Downloading PHP

First you must download the newest non Thread Safe version from the [PHP Website](#). When this entry was written, this was the [newest version](#)

2 Unpacking PHP

Unpack the downloaded .zip file to a chosen folder, for example C:/PHP

3 Modify the INI File

Next you must enter your PHP folder and rename your `php.ini-production` to `php.ini`. You must open this file with your text editor and replace some rows by using the following table:

line number(*)	search for	replace with
466	<code>display_errors = Off</code>	<code>display_errors = On</code>
736	<code>; extension_dir = "ext"</code>	<code>extension_dir = "ext"</code>
888	<code>; extension=php_mbstring.dll</code>	<code>extension=php_mbstring.dll</code>
895	<code>; extension=php_pdo_mysql.dll</code>	<code>extension=php_pdo_mysql.dll</code>
899	<code>; extension=php_pdo_sqlite.dll</code>	<code>extension=php_pdo_sqlite.dll</code>

(*) The line number can differ, which depends on the used version. The used line numbers in the table above are from the PHP-version 5.6.12 x86.
